

Unreal Engine – Motion Design Feedback

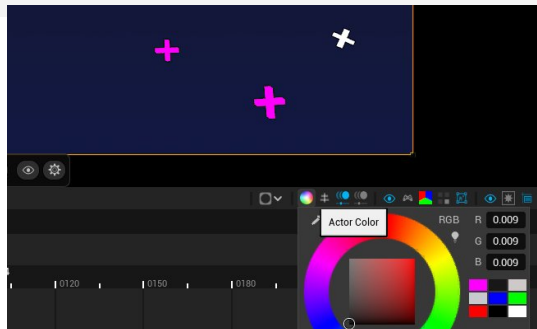

UE version: 5.7

Hey Epic team, I've been iterating in the Motion Design template and the Material Designer for the first time and hit a number of issues. They're grouped below into likely bugs and a couple of suggestions.

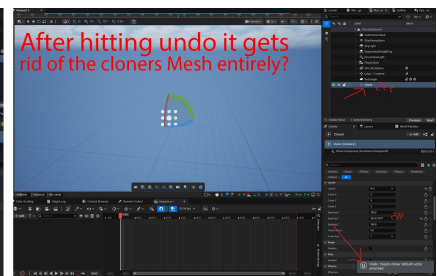

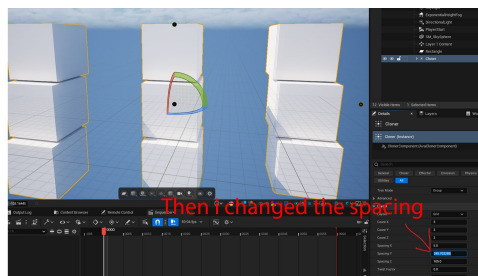

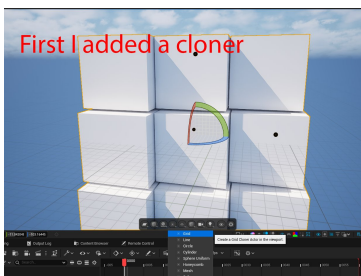

1. Undo is unavailable for most new operations

Many operations can't be undone, which makes iterating hard. For example, after using the color picker to pick a new color, I can't undo it... there's no way back to my previous color.

Expected: Ctrl+Z should revert color changes and most other actions, like changing variables in the Details Panel (Undo doesn't work there aswell).

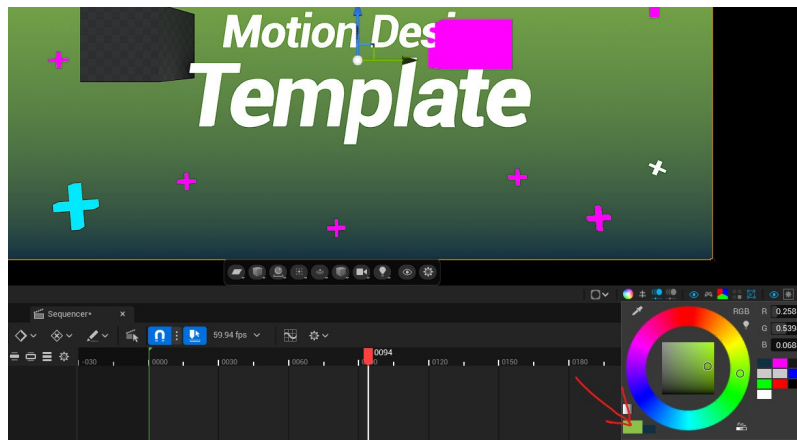

Another example:

2. Can't edit the secondary gradient color from the quick toolbar without switching color.

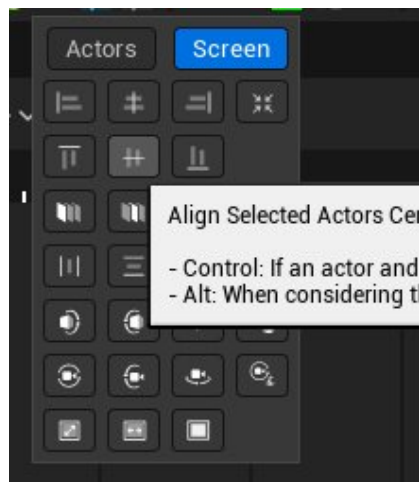

When using a gradient, I can't change the secondary color from the quick toolbar without first switching to it which makes the Gradient mirror which is unfortunate for a Design Approach.

Expected: Both gradient stops should be editable directly in the quick toolbar without making them switch places or using the Details Panel.

3. Alignment menu closes after every selection

After I click an alignment option, the menu closes, so I have to reopen the Align menu each time I want to try a different alignment.

Expected: The menu should stay open so I can apply several alignments in a row.

4. "F" focus snaps back in camera mode

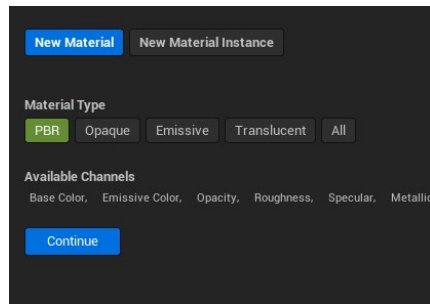

In camera mode, pressing F frames the view and then immediately snaps back.

Expected: I understand why this is the way it is but I would simply disable it or F should frame the selection and get back to the Camera viewport on release.

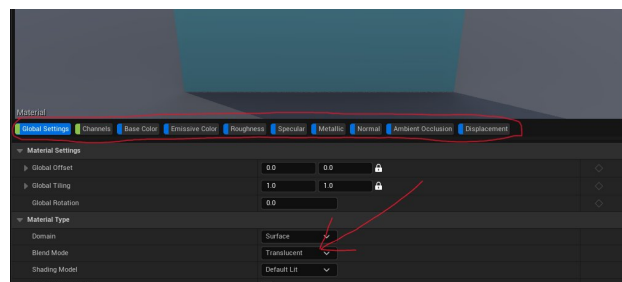

5. Material Designer: Translucent blend mode doesn't persist, and Opacity is missing without restarting

Steps to reproduce:

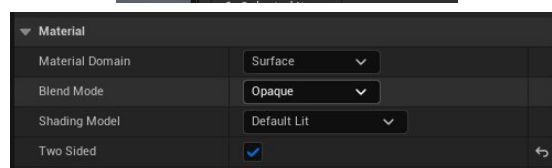

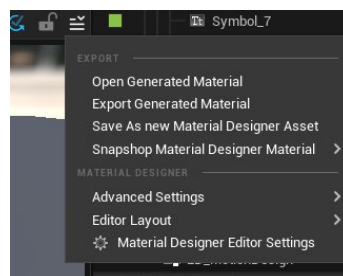

1. Create a PBR material.

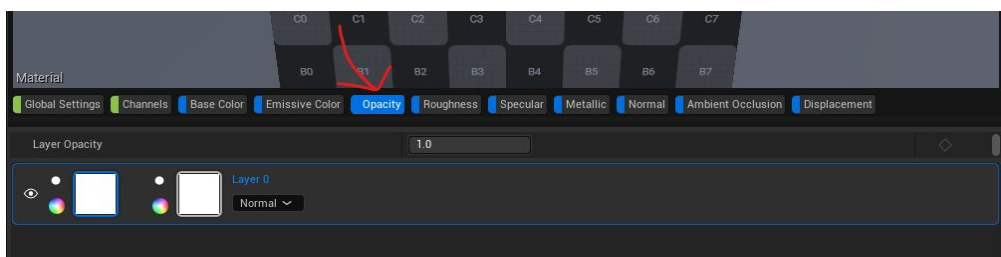

2. Switch it to translucent. I can set the blend mode to Translucent in Global Settings, but there's no option to set Opacity.

3. If I open the generated material asset the blend mode has reverted to Opaque.

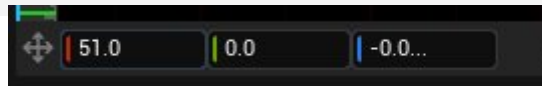

5. The only fix: fully close the Material Designer, reopen it, then open the generated material again —> now the blend mode is correct and the Opacity option finally appears.

Expected: Choosing Translucent in Global Settings should expose the Opacity option immediately or ask me to restart the window, and the blend mode should persist in the generated material without needing to close and reopen the Material Designer.

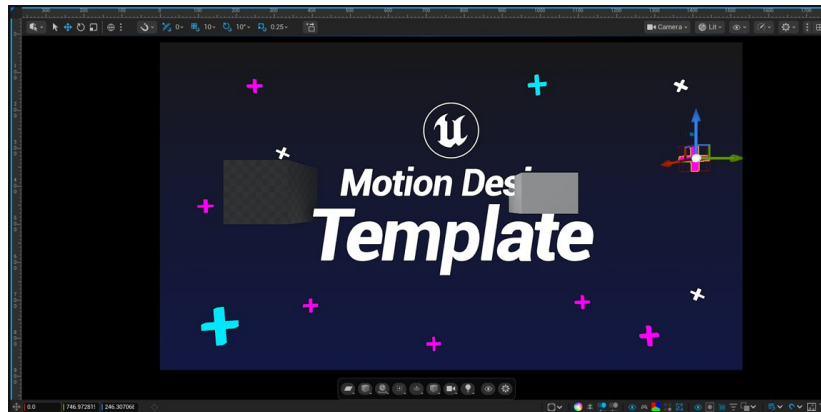

6. Z axis as depth in the 2D Motion Design template

Expected: In my opinion, the Z axis should represent depth in the 2D Motion Design template.

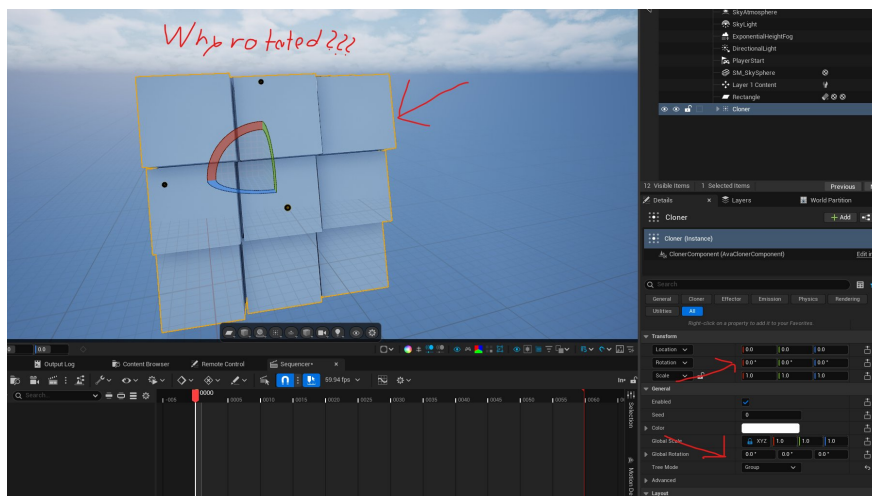

7. Motion Design Window stays even though not in Motion Design Mode

One of the bigger problems for me is that the window stays in Motion Design view even though I selected Selection Mode and not Motion Design Mode.

8. When spawning a Cloner I can't revert the rotation and location to 0.

Expected: I understand that it creates the location from the viewports Rotation and Location but making all values 0 should bring it back to the origin with 0 rotation.

9. Suggestion

Please make per Instance operations possible in the material graph for the cloners!

I hope that helps further developing the product! Thanks!
